Nutrition Program

Newborns have unique nutritional needs. Human milk nutrition and bioactive profiles change over the course of lactation. That's why we batch donor milk by the stage of lactation. We also test each batch for nutrition content.

Program Highlights

- Nutrition analysis is performed on each batch with the FOSS Milkoscan FT-120.
- Donor milk bottles are labeled with calories/oz and total protein.
- To ensure consistency, we recommend fortification based on a 20 cal/oz assumption. In special situations, your nutrition team may choose to individualize fortification.
- Each donor milk bottle contains bioactive factors that support newborn growth and development.
